Education

KAIST (Korea Advanced Institute of Science and Technology)

Sep. 2018 - Feb. 2024

Ph.D. (Electrical Engineering)

Advisor: Dongsu Han and Young Seok Ju

KAIST (Korea Advanced Institute of Science and Technology)

Feb. 2014 - Aug 2018

Bachelor of Science in Electrical Engineering

Awards and Honors

Samsung Electronics 29th Humantech Paper Award (Silver Prize, Communication & Networks)

Feb. 2023

Samsung PhD Sponsorship

Feb. 2022

1st Place in Kiwoom US Stock Trading Competition (ROI 201%, out of 10K participants)

Sep. 2020

Work Experience

Inocras Inc. (formerly Genome Insight Inc.)

Aug 2023 - Present

AI tech lead

Republic of Korea

Projects

1. Enhancing Genome Analysis Pipeline with AI and ML

Generalizing Deep Variant Callers via Domain Adaptation and Semi-supervised learning | Pytorch Aug 2023

- Deploying deep learning-based variant callers (DVCs) to a sequencing method with varying error profiles necessitates generalization which is challenging due to their reliance on extensive labeled data.
- Developed a generalization framework that enables DVCs (e.g., Google DeepVariant, Clair3) to accommodate diverse sequencing methods, leveraging semi-supervised learning and domain adaptation techniques.
- Improved SNP and INDEL F1-score by up to **6.40 %p and 9.36 %p** or achieves the same variant calling accuracy using merely half of the labeled data compared to the supervised training approach in the sequencing method of interest.

BWA-MEME: Machine-learning Enhanced Read Alignment Software | C++, Rust, SIMD vector

May 2022

- BWA MEM is an industry-standard alignment software developed by the Broad Institute of MIT and Harvard for next-generation sequencing data.
- Developed and open-sourced a short-read alignment software, BWA-MEME, that achieves up to **3.45x speedup** in seeding throughput over its' predecessor, BWA-MEM2 from Intel, while ensuring identical output.
- BWA-MEME is now operational in the production environments of numerous institutions, projected to lower alignment costs by 35%. This efficiency translates into **millions of \$ in cost reductions** for projects on a million-genome scale.

2. Deep Learning for High-performance Network System

LiveNAS: Deep Learning-based Live Video Streaming (SIGCOMM'20) | C++, Python, Pytorch

July 2020

- Developed live video streaming system based on Google WebRTC which involves; **1)** Online training and inference system for super-resolution DNN model during live video streaming. **2)** Bandwidth allocation algorithm to maximize user Quality of Experience (QoE).
- LiveNAS system delivers live video with the same quality as Google WebRTC **using only 45.9% bandwidth** on average or **enhances average QoE by 69%** compared to WebRTC using the same bandwidth.

TLT:Timeout-less Transport Protocol (EuroSys'21) | C++, Switch configuring

March 2019

- Implemented data-center network protocols (TLT, PFC) in NS-3 network simulator. TLT protocol was also implemented in Linux kernel and tested in real-world testbed.
- TLT augments diverse datacenter transports, from widely-used (TCP, DCTCP, DCQCN) to state-of-the-art (IRN and HPCC), by achieving up to **81% lower tail latency**.

NAS:Deep Learning-based Internet Video Delivery (OSDI'18) | Python, Tensorflow, Google Cloud

October 2018

- Developed an adaptive bit-rate streaming algorithm based on Reinforcement Learning (a3c) for NAS on top of MPEG-DASH—a video-on-demand system such as Youtube or Netflix.
- NAS enhanced the **average QoE by 43.08%** using the same bandwidth budget or **saving 17.13% of bandwidth** while providing the same user QoE compared to MPEG-DASH.

Technical Skills

Languages: Python, C++, Rust, SQL, shell scripting

Technologies/Frameworks: Linux, Pytorch, Tensorflow, Git, Cloudstack, Docker, Spark, AWS, Python Django, Node.js

Publications

- TopFull: An Adaptive Top-Down Overload Control for SLO-Oriented Microservices** *ACM SIGCOMM 2024*
